. Job Description

About Us

VallumFlow™ is a security workflow automation platform built for modern engineering teams. We specialize in automating complex security tasks across the SDLC. Our platform provides a central orchestration engine that unifies SAST, DAST, and SCA telemetry into a visual workflow builder. Our mission is to bridge the gap between development speed and security by removing manual bottlenecks.

Role Description

This is a full remote 3-month internship for a Software Engineering Intern with a focus on Core AI and Security Research. This role focuses on the architecture and implementation of autonomous security agents. The intern will research emerging agentic patterns, implement logic for automated vulnerability reasoning, and contribute to VallumFlow's core intelligence layer. You will also be responsible for synthesizing your research into high-quality technical blogs and white papers, effectively communicating complex architectural concepts to the engineering community. This position has an immediate start date.

Qualifications

- Strong grasp of Computer Science fundamentals, particularly in algorithms and data structures.
- Technical understanding of LLM internals, vector embeddings, and agentic reasoning.
- Ability to read, understand, and implement concepts from technical research papers.
- Proficiency in Golang (preferred) or Python, with a strong focus on writing clean, performant backend code.
- Knowledge of Application Security practices and common vulnerabilities.
- Proficient technical writing skills i.e. ability to document research and write engineering-focused blogs.
- Self-driven with a passion for building novel solutions in the DevSecOps space
